Practical conservation and amelioration of human wildlife conflict – a global collaboration with zoos and other donors

WWA is a nonprofit conservation organization with fundraising bases in the USA, South Africa, and the UK. WWA provides equipment, not cash, to support established field projects and help conservationists and researchers work more effectively.

The importance of pack structure to the conservation management and breeding success of African wild dogs (including the impact of habitat type, and presence of lions and elephants on distribution).

A PhD behavioral study by Helen Reynolds in Namibia

Aim: To improve the survival chances of relocated African wild dogs.

Equipment contributed by WWA: Trail cameras and IT, including laptop for data analysis.

Conservation and Management of two African wild dog packs

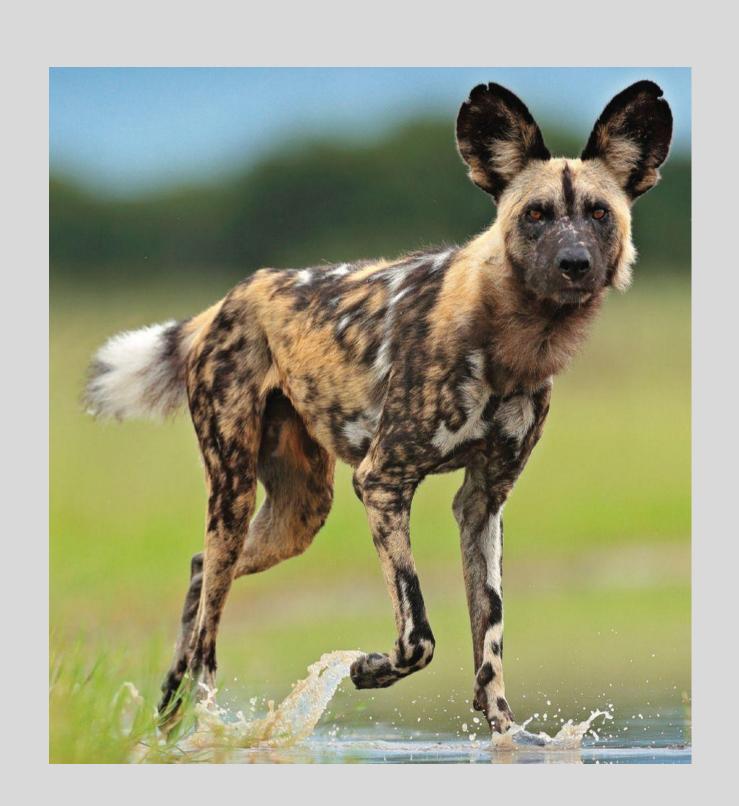

Madikwe Game Reserve – the fifth largest reserve in South Africa, home of the 'Big Five'

Aim: To help monitor seasonal pack movements, breeding, and social behavior, to better understand how to protect, manage, and conserve two 'manufactured' packs of introduced relocated dogs.

Equipment contributed by WWA: Two radio-telemetry collars for one dog in each pack, including the veterinary costs of darting and GPS tracking.

African wild dogs (Lycaon pictus) – a critically endangered CITES Red List species, with perhaps only 6000 left in the wild, of which only a very small percentage will ever breed but who contribute to the social rearing success of their pack. Found in such disparate populations as to require a metapopulation management program across southern Africa to improve breeding success and help ensure genetic diversity. This increasingly requires darting, relocation and 'pack building' of unrelated dogs in suitable new habitat.
